Test Method:

The specified electro-optical characteristics is satisfied under the following Conditions at the controllable distance.

①Measurement place

A place that is nothing of extreme light reflected in the room.

②External light

Project the light of ordinary white fluorescent lamps which are not high Frequency lamps and must be less then 10 Lux at the module surface. ($Ee \le 10Lux$)

③Standard transmitter

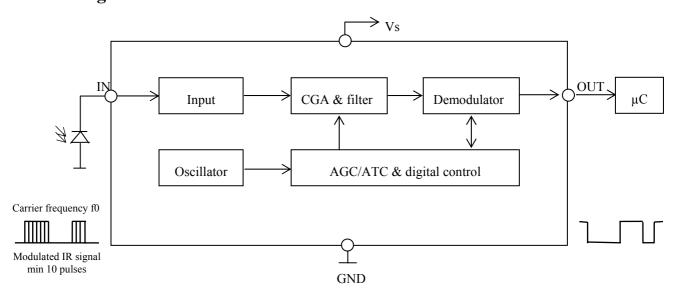

A transmitter whose output is so adjusted as to **Vo=400mVp-p** and the output Wave form shown in Fig.-1.According to the measurement method shown in Fig.-2 the standard transmitter is specified.

However , the infrared photodiode to be used for the transmitter should be $\lambda p=940$ nm, $\Delta\lambda=50$ nm. Also, photodiode is used of PD438B(Vr=5V). (Standard light / Light source temperature 2856°K).

Measuring system

According to the measuring system shown in Fig.-3

The Notice of Application:

Transmission of remote control signal consist of four parts: Encode Part, IR Transmitter Source, IRM device, Decode Part

- 1. When IRM-2636T code select frequency, it need to well understand the center system of encode part.
- 2. Strong or weak light of IR Transmitter can affect distance of transmission.
- 3. When using IRM-2636T device, it requires the composition of code pattern to reach the demand as follows:

| Minimum t _{burst} (number of pulses per burst) | Minimum t _{burst_gap} (number of pulses between two burst) | Minimum t _{pause} |
|--|--|----------------------------|
| 10 pulses | 14 pulses | 25 msec |

4. It needs to ensure the translation range of decode part if it is applied to the pulse-width range.

If the above items hardly assure of its application, it'll cause NG(no good) message from the edge of signal.
